explosion hazards involving mixtures of different states of aggregation continue to occur in facilities where dusts gases or solvents are handled or processed in order to prevent or mitigate the risk associated with these mixtures more knowledge of the explosion behavior of hybrid mixtures is required the aim of this study is to undertake an extensive investigation on the explosion phenomenon of hybrid mixtures to obtain insight into the driving mechanisms and the explosion features affecting the course of hybrid mixture explosions this was accomplished by performing an extensive experimental and theoretical investigation on the various explosion parameters such as minimum ignition temperature minimum ignition energy limiting oxygen concentration lower explosion limits and explosion severity mixtures of twenty

combustible dusts ranging from food substances metals plastics natural products fuels and artificial materials three gases and six solvents were used to carry out this study three different standard equipments the 20 liter sphere for testing lower explosion limits limiting oxygen concentration and explosion severity the modified hartmann apparatus for testing minimum ignition energy and the modified godbert greenwald gg furnace for testing minimum ignition temperature were used the test protocols were in accordance with the european standard procedures for dust testing for each parameter however modifications were made on each equipment in order to test the explosion properties of gases solvents and hybrid mixtures the experimental results demonstrated a significant decrease of the minimum ignition temperature minimum ignition energy and limiting oxygen concentration of gas or solvent and increase in the likelihood of explosion when a small amount of dust which was either below the minimum explosion concentration or not ignitable by itself was mixed with gas or solvent and vice versa for example methane with minimum ignition temperature of 600 c decreased to 530 c when 30 g m<sup>3</sup> of toner dust which is 50 below its minimum explosible concentration was added a similar explosion behavior was observed for minimum ignition energy and limiting oxygen concentration furthermore it was generally observed that the addition of a non explosible concentration of flammable gas or spray to a dust air mixture increases the maximum explosion pressure to some extent and significantly increases the maximum rate of pressure rise of the dust mixture even though the added concentrations of gases or vapor are below its lower explosion limit finally it could be said that one cannot rely on the explosion properties of a single substance to ensure full protection of an equipment or a process if substances with different states of aggregate are present

fuel cells are expected to play a major role in the future power supply that will transform to renewable decentralized and fluctuating primary energies at the same time the share of electric power will continually increase at the expense of thermal and mechanical energy not just in transportation but also in households hydrogen as a perfect fuel for fuel cells and an outstanding and efficient means of bulk storage for renewable energy will spearhead this development together with fuel cells moreover small fuel cells hold great potential for portable devices such as gadgets and medical applications such as pacemakers this handbook will explore specific fuel cells within and beyond the mainstream development and focuses on materials and production processes for both sofc and lowtemperature fuel cells analytics and diagnostics for fuel cells modeling and simulation as well as balance of plant design and components as fuel cells are getting increasingly sophisticated and industrially developed the issues of quality assurance and methodology of development are included in this handbook the contributions to this book come from an international panel of experts from academia industry institutions and government this handbook is oriented toward people looking for detailed information on specific fuel cell types their materials production processes modeling and analytics overview information on the contrary on mainstream fuel cells and applications are provided in the book hydrogen and fuel cells published in 2010
