Extreme Pressure and Anti-Wear Properties of Lubricants Testing Extreme Pressure and Anti-Wear Performance of Crankcase and Gearbox Lubricants *MA. Plint MA. Plint*

the most widely used standard tests for the evaluation of wear and extreme pressure properties are analysed in terms of eight tribological parameters wide variations in the test conditions are disclosed and the over riding influence of thermal conditions on test severity is made clear the relation between tests such as the timken in which one of the two rubbing surfaces is static and gear or cam and follower tests in which both specimens move is explored a preliminary account is given of a new test procedure evolved as a result of the study

when designing a bench test to model wear in lubricated contacts associated with engine and gearbox applications considerations of scale are important it is hazardous simply to attempt to define the real life conditions load speed temperature etc and glibly apply them to test pieces on a bench test machine if large amounts of energy are being dissipated in small test specimens with supporting structures that do not allow the heat to escape then it is clear that the specimens will become very hot the bulk temperature may exceed what is experienced in practice producing transitions in wear or frictional response this paper outlines the relationship of wear and failure to energy dissipation in terms of two global parameters matveesky s friction power intensity and plint s energy pulse and applies these to previously published data it then shows how these can be used in the design of appropriately scaled simple bench test procedures for the evaluation of lubricants for two practical ehd lubricated contacts gears and cam follower
