decision making arises when we wish to select the best possible course of action from a set of alternatives with advancements of the digital technologies it is easy and almost instantaneous to gather a large volume of information and or data pertaining to a problem that we want to solve for instance the world wide web is perhaps the primary source of information and or data that we often turn to when we face a decision making problem however the information and or data that we obtain from the real world often are complex and comprise various kinds of noise besides real world information and or data often are incomplete and ambiguous owing to uncertainties of the environments all these make decision making a challenging task to cope with the challenges of decision making searchers have designed and

developed a variety of decision support systems to provide assistance in human decision making processes the main aim of this book is to provide a small collection of techniques stemmed from artificial intelligence as well as other complementary methodologies that are useful for the design and development of intelligent decision support systems application examples of how these intelligent decision support systems can be utilized to help tackle a variety of real world problems in different domains e.g. business management, manufacturing, transportation and food industries and biomedicine are also presented. A total of twenty chapters which can be broadly divided into two parts i.e.

improve stands for information technology support for collaborative and distributed design processes in chemical engineering and is a large joint project of research institutions at RWTH Aachen University. This volume summarizes the results after 9 years of cooperative research work. The focus of improve is on understanding, formalizing, evaluating and consequently improving design processes in chemical engineering. In particular, improve focuses on conceptual design and basic engineering where the fundamental decisions concerning the design or redesign of a chemical plant are undertaken. Design processes are analyzed and evaluated in collaboration with industrial partners.

How can we develop a scientific basis for architectural, urban and technical design when can a design be labelled as scientific output comparable with a scientific report? What are the similarities and differences between design and empirical research and between design research, typological research, design study and study by design? Is there a need for a particular methodology for design driven study and research? With these questions in mind, more than forty members of the faculty of architecture of the Delft University of Technology have described their ways of study and research. Each chapter shows the objectives, the methodology and its implementation in search for a deeper knowledge of design processes and an optimal quality of the design itself. The authors, among them architects, urban planners, social scientists, lawyers, technicians and information scientists, have widely differing backgrounds. Nevertheless, they share a great deal: the central focus is a better understanding of design processes, design tools and the effects of design interventions on issues such as utility, aesthetics, meaning, sustainability and feasibility.

box for balanced automation research in this area is still young and emerging. In our opinion, the development of hybrid balanced solutions to cope with a variety of automation levels and manual approaches is a much more challenging research problem than the search for a purely automatic solution. Various research activities described in this book illustrate some of these challenges through the development proposals, assisting tools and initial results in certain chapters. However, the balancing aspects are not yet achieved in the research area, but their inclusion in this book is

intended to give a broader and more comprehensive perspective of the multiple areas involved one important aspect to be noticed is the extension and application of the concept of balanced automation to all areas of the manufacturing enterprise clearly the need for a balanced approach is not restricted to the shop floor components rather it applies to all other areas as illustrated by the wide spectrum of research contributions found in this book for instance the need for an appropriate integration of multiple systems and their perspectives is particularly important for the implantation of virtual enterprises although both the basys 95 and the basys 96 conferences have provided important contributions approaches and tools for the implantation of balanced automation systems there are a number of areas that require further research
