binocular vision is achieved by five neurovisual systems originating in the retina but varying in their destination within the brain two systems have been widely studied the retino tectal or retino collicular route which subserves an expedient and raw estimate of the visual scene through the magnocellular pathway and the retino occipital or retino cortical route which allows slower but refined analysis of the visual scene through the parvocellular pathway but there also exist further neurovisual systems the retino hypothalamic retino pretectal and accessory optic systems which play a crucial role in vision though they are less understood the retino pretectal pathway projecting onto the pretectum is critical for the pupillary or photomotor reflex the retino hypothalamic pathway projecting onto the suprachiasmatic nucleus regulates numerous behavioral and biological functions as well as circadian rhythms the accessory optic system targeting terminal lateral medial and dorsal nuclei through the paraoptic fasciculus plays a role in head and gaze orientation as well as slow movements taken together these neurovisual systems involve 60 of brain activity thus highlighting the importance of vision in the functioning and regulation of the central nervous system but vision is first and foremost action which makes perception impossible without movement binocular coordination is a prerequisite for binocular fusion of the object of interest on the two foveas thus ensuring visual perception the retino collicular pathway is sufficient to elicit reflexive eye movements with short latencies thanks to its motor neurons the superior colliculus activates premotor neurons which themselves activate motor neurons of the oculomotor trochlear and abducens nuclei at a higher level a cascade of neural mechanisms participates in the control of decisional eye movements the superior colliculus is controlled by the substantia nigra pars reticulata which is itself gated by subcortical structures such as the dorsal striatum the superior

colliculus is also inhibited by the dorsolateral prefrontal cortex through a direct prefrontotectal tract cortical areas are crucial for the triggering of eye movements the frontal eye field supplementary eye field and parietal eye field finally the cerebellum maintains accuracy the focus of the present research topic entitled neural bases of binocular vision and coordination and their implications in visual training programs is to review the most recent findings in brain imaging and neurophysiology of binocular vision and coordination in humans and animals with frontally placed eyes the emphasis is put on studies that enable transfer of knowledge toward visual training programs targeting visual field defects e g hemianopia and binocular functional disorders e g amblyopia

standardized testing in the united states has been increasing at a rapid pace in the last twenty five years the market for tests has not only been expanding rapidly but has also been changing sharply in structure into a fractured marketplace indeed one of the main features of this book is that the market for standardized testing is highly fractured with segments of the market facing monopoly conditions others facing oligopoly conditions and still others where near free market conditions exist one of the main premises of the book is that the structures of markets have strong implications for how those markets perform while this notion is widely accepted among economists it is not widely appreciated in educational research a second motivation for the book is that very little scholarly attention has been focused on the standardized testing industry this topic the structure of the testing industry and implications for the quality of tests and test use affects how we evaluate the learning of students the effectiveness of teaching the quality of schools and the educational health of the nation of particular concern to the authors is one vital aspect of test quality test validity this book is the most current and authoritative review and analysis of the market for standardized testing

the 2002 no child left behind act is the most important legislation in american education since the 1960s the law requires states to put into place a set of standards together with a comprehensive testing plan designed to ensure these standards are met students at schools that fail to meet those standards may leave for other schools and schools not progressing adequately become subject to reorganization the significance of the law lies less with federal dollar contributions than with the direction it gives to federal state and local school spending it helps codify the movement toward common standards and school

accountability yet nclb will not transform american schools overnight the first scholarly assessment of the new legislation no child left behind breaks new ground in the ongoing debate over accountability contributors examine the law s origins the political and social forces that gave it shape the potential issues that will surface with its implementation and finally the law s likely consequences for american education
